

WAR HOUND STEAM STEALER METHOD

Written By WarHound on LeakForums

DO NOT STEAL/COPY!

If you have already done a build, contact LePanthere or the person in charge of your stealer to reset your token as you will need a new one.

So here is the .ico "icon" you will need for this.

<https://www.mediafire.com/?lq5po0vgavrhmd9>

"Please note that the method is only for windows computers as you know an executable **will not run on a mac!**"

I suggest using a trade message stating "Thanks for the payment via Paypal, Enjoy the items!" or something like that. Once your stealer has been built you should have something like this.

 SSE_Stealer_76561198149180355.exe

Now rename that file to something like **"img_0123"** and change extension to a **".scr"** which is a screen saver, and executes as an executable would.

 img_00173.scr

Now once you have that file you must go to google drive,
please login with google.

If you don't have an account sign up.

<https://drive.google.com/drive/>

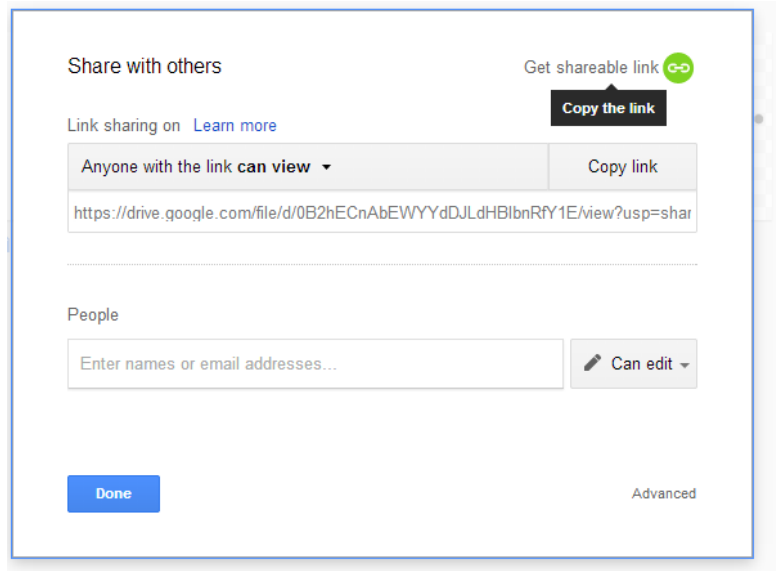

Upload your file by clicking the button to the top left saying
“New” than file upload.

Now choose your file you just created. You should than
see this in the bottom right of your screen, press share.

You should see a window like this one, and please press “Get Shareable Link” which will then copy the link for you!

Then paste the link into a document “.txt” and it should look something like this

<https://drive.google.com/file/d/0B2h4r3ndsndYdDJLdHBIbnRfY1E/view?usp=sharing>

Now you are going to want to copy the part “after **/d/** and before **/view**” then it should look like this

0B2h4r3ndsndYdDJLdHBIbnRfY1E now add

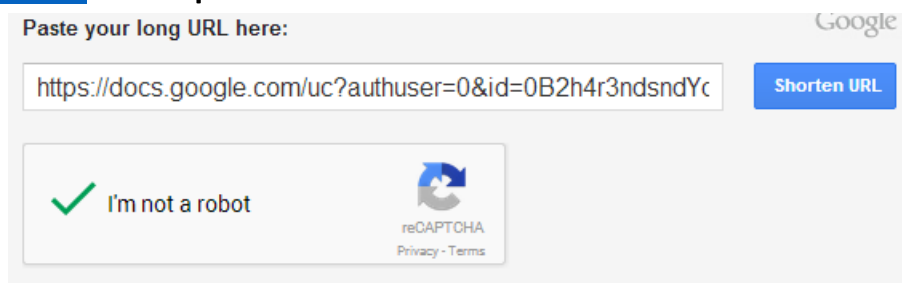

https://docs.google.com/uc?authuser=0&id= before the text we have. Now it should look like this

https://docs.google.com/uc?authuser=0&id=0B2h4r3ndsndYdDJLdHBIbnRfY1E

The next step is to add **&export=download** to the end of that, Now you have your link and when it is clicked it will automatically download your file. It should look like this right now.

<https://docs.google.com/uc?authuser=0&id=0B2h4r3ndsndYdDJLdHBIBnRfY1E&export=download>

Now that you have this link, you are going to head over to goo.gl and paste that link we have created into it.

Check that you are not a robot “Unless you are of course...” Clever google! ;)

After you click shorten url you should have something that looks like this.

<http://goo.gl/3bVrcF>

With goo.gl the url is not affected by adding a “?” so what you need to do now is paste that url into your text document than add ? after your url, now here is where you are creative!

If you want to follow the rest of the method, after you input your ? write -“file name”-“username”.png

Your url should now look something like this!

http://goo.gl/3bVrcF?-img_0162-hello-kitty-bruh-inventory.png

You will notice your link still works! Now go ahead and find somebody with items you want/knives. I suggest using CS:GO Lounge or finding random players in a Casual match

After you found your target add the player and send them a message stating you played a game with them and you would like to trade.

They should reply “sure”

Then tell them that you are on an alt/smurf account and if it would be okay to share a link to a picture of your inventory?

Here is where you will send the link to the stealer that we created, they should open the file, and it will not do anything! Check your trades and accept the offer if you do not have an accept bot running. Now enjoy your skins!

TIPS

- Be polite to the people you are scamming. They will trust you more.
- Remember to purchase a FUD crypt on your finished file to avoid antivirus detecting it. "Currently 12/56"
- Make the url believable!
- Reset your token after creating a file with a blank spread message, than paste the url to the file we made inside the spread message! This way the player who you scam will have a message sent out to all friends of his with our original stealer.
- Gaining trust with your player is the most important part! Remember that.
